STANDARD MAINTENANCE

Tape Head and Capstan Cleaning

Whenever a unit is brought in for service or repair, clean the tape heads, capstan drive shaft and other tape handling surfaces to ensure proper handling run and optimum frequency response. Use a cotton swab dipped in head cleaner or denatured alcohol. Wipe dry.

Tape Head Demagnetization

Do not use magnetized tools near the tape heads, since they can magnetize the head. After long period of use the heads will retain a small amount of residual magnetism. A magnetized head will result in loss of high frequency response and increased noise. Use a standard tape head demagnetizer and follow the instructions supplied with it to demagnetize the heads.

Azimuth Adjustment

- Azimuth adjustment is normally only required when the head is replaced, or for cases of cross-talk and poor high frequency response. A test tape is required for such adjustment.
- Connect a scope or VTVM to the right channel output. Insert a test tape into the unit (Use a test tape such as TEAC MTT-114, MTT-115). Adjust the azimuth adjustment screw for maximum output onto the right channel. Use glyptal or other non-hardening cement to lock the azimuth adjustment screw.
